REMINDERS

- ❖ Two required essays are still due by <u>April 17, 2020</u>.
- A late penalty will be applied.
- ✓ A third essay may be used for extra credit in place of a "Think Geographically" essay.

ESSAY TOPICS (choose any two):

- Contributions of a noted geographer, earth scientist or explorer (ch. 1)
- Relationship of climate change to a listed current event topic (ch. 2)
- Discuss a natural process that is deemed a natural hazard (ch. 3)

□ Atlas Extra Credit for Exam II
is available on the Course Home
Page and on BlackBoard.
The answer sheet (last page) is
to be emailed to
agrande@hunter.cuny.edu
by 11 PM March 31, 2020

* Extra Credit:

"Think Geographically" Essays from <u>any five</u> of the textbook's **chapters 4-12**.

Last day to submit as of now is
 May 12 but it is best to do them as you finish reading a chapter.

- Any essay may be handed in before the deadline.
- Don't wait for the night before to write them!

PART II: People and their Physical Environment

- ✓ I. Introduction to the Physical Environment
- ✓ II. Earth-Sun Relationship
 - **III. Earth Systems**
- ✓ A. The Hydrosphere: Oceans
- ✓ B. The Atmosphere: Weather and Climate
- ✓ C. The Lithosphere: Geologic Influences/Landscape Developmt
- IV. Earth Habitat
 - A. Biosphere
 - **B. Natural Controls and Cycles**
 - C. Human Impact
 - D. Natural Hazards
 - E. Earth Resources

GEOG 101 Part II People and their Physical Environment

16: Earth Habitat The Biosphere

Prof. Anthony Grande Hunter College Geography

PHYSICAL SYSTEMS

The earth's physical environment is composed of the:

- 1. Atmosphere (air)
- 2. Hydrosphere (water)
- 3. Lithosphere (land)
- 4. Biosphere (life)

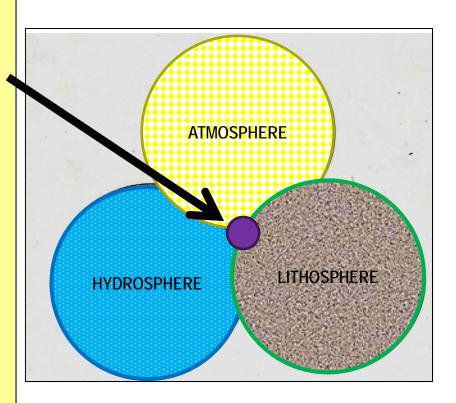

BIOSPHERE

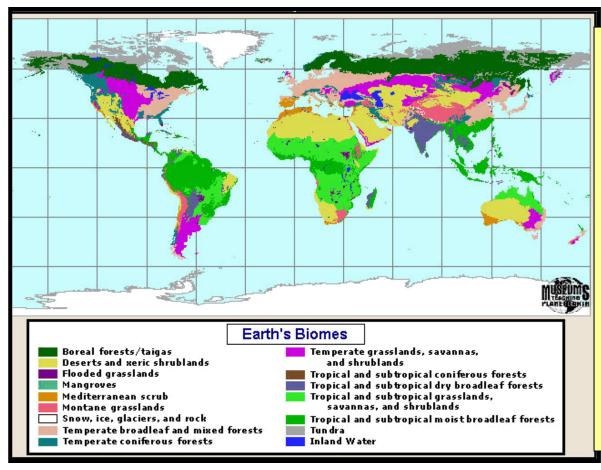

The BIOSPHERE is at the interface of air, land and water. It is SUN dependent.

All lifeform characteristics are a result of variations in the components of the biosphere: temperature, moisture, elevation, slope angle.

Plants are most sensitive to change because they cannot relocate quickly.

BIOMES

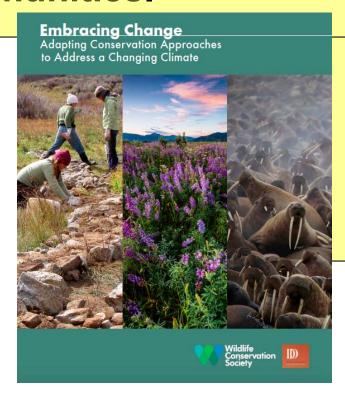

***BIOMES** are zones of life.

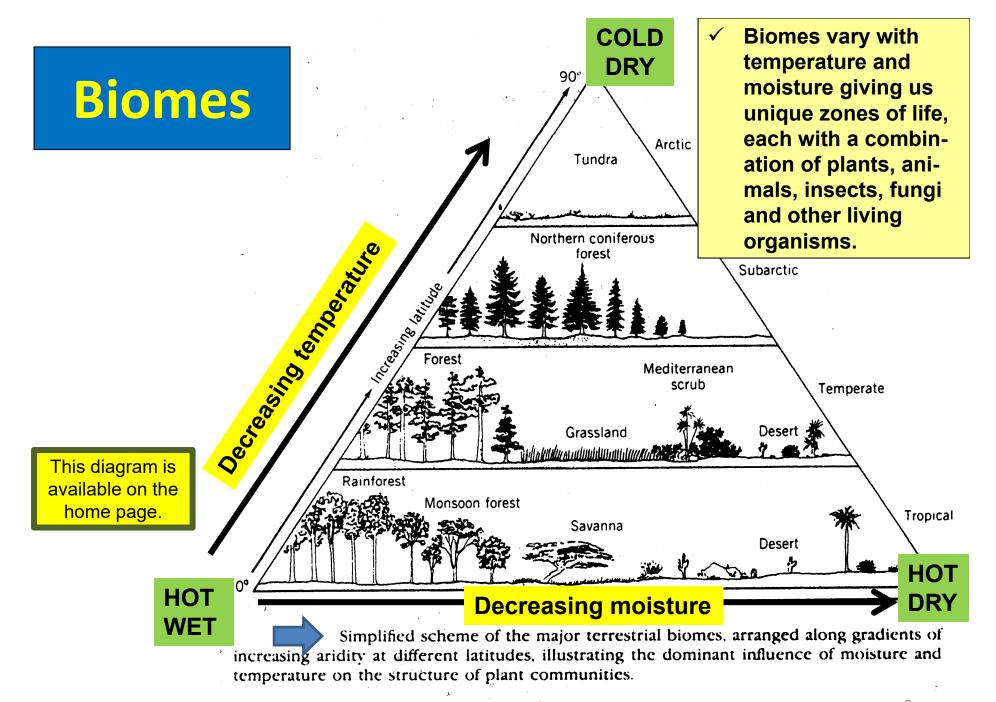

- As ecoregions, they are unique combinations of climate, life forms (flora, fauna, fungi, etc.) and soils.
- They are composed of many ecosystems.

Biomes

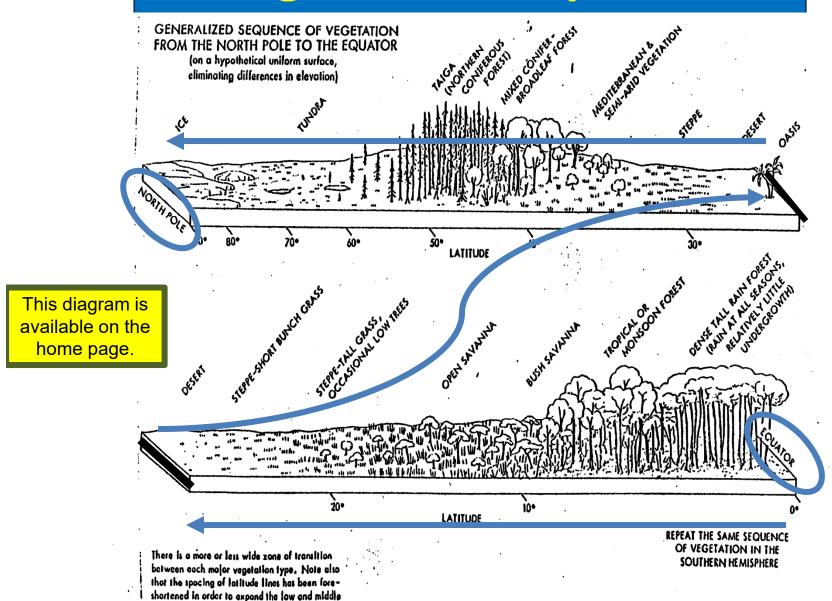

❖ Terrestrial (land) biomes vary with temperature and moisture giving us unique plant and animal communities.

- Each species has characteristics that allow it to survive within its physical environment.
- The components of biomes have to be preserved, recycled and renewed to avoid reaching carrying capacity (maximum life support) and to maintain the quality of its habitat (quality varies with conditions).

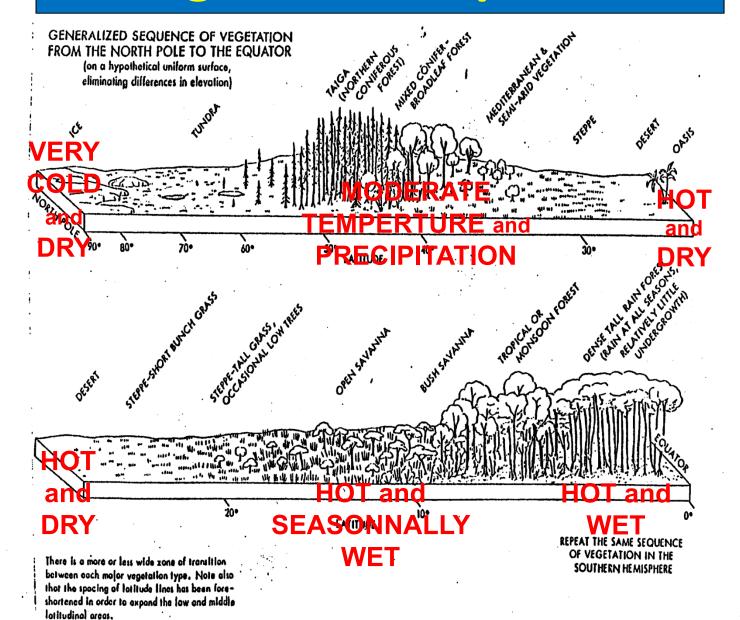

Vegetation Sequence

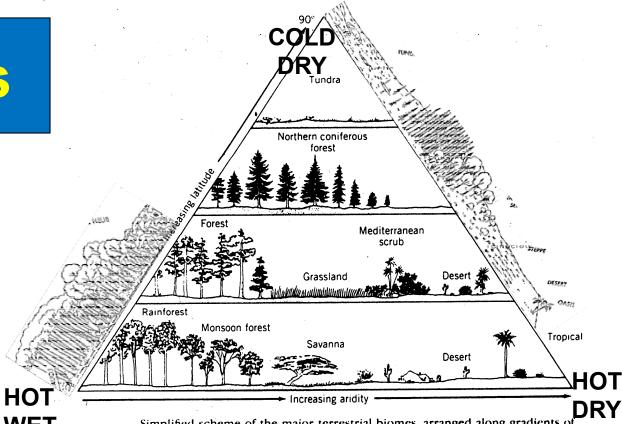

latitudinal areas.

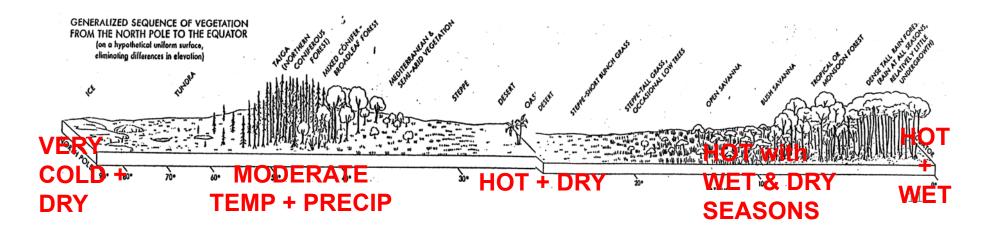

Vegetation Sequence

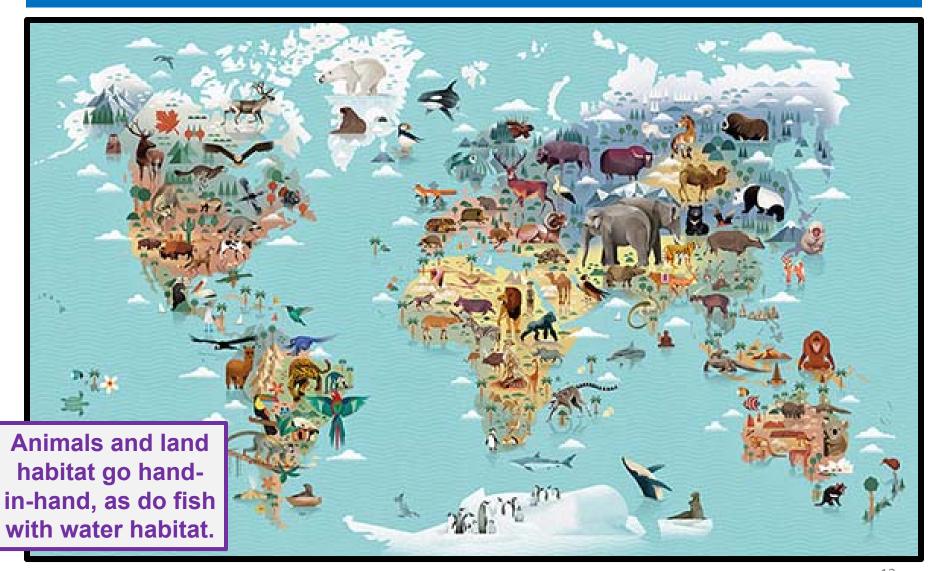

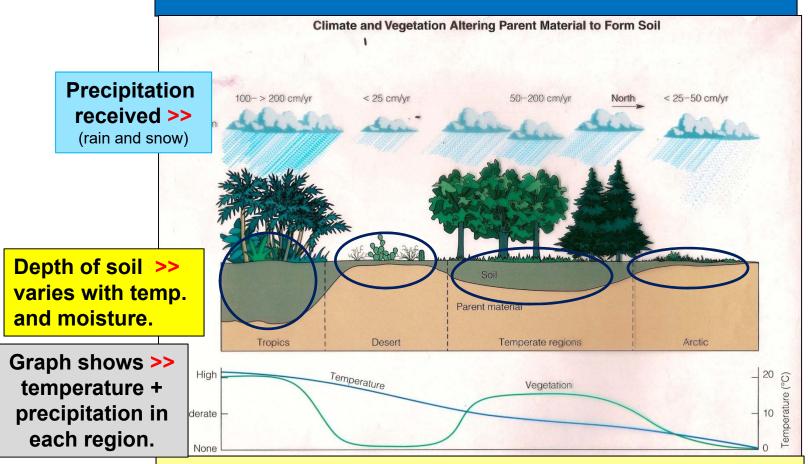

Simplified scheme of the major terrestrial biomes, arranged along gradients of increasing aridity at different latitudes, illustrating the dominant influence of moisture and temperature on the structure of plant communities.

Simplified World Map of Animals

Soil Formation

Soil formation depends on temperature and moisture working on bedrock and organic material over time.

Climax Vegetation

BIOMES: zones of life that develop in a unique combination of temperature, moisture, soil and sunlight.

- **❖ Climax vegetation** is the <u>best species</u> for the existing conditions within the biome.
 - When conditions change, new species <u>better</u> <u>suited</u> for the conditions invade and a <u>new</u> <u>sequence</u> of plant growth begins.
 - > When it stabilizes, climax vegetation is again attained.

Climax Community

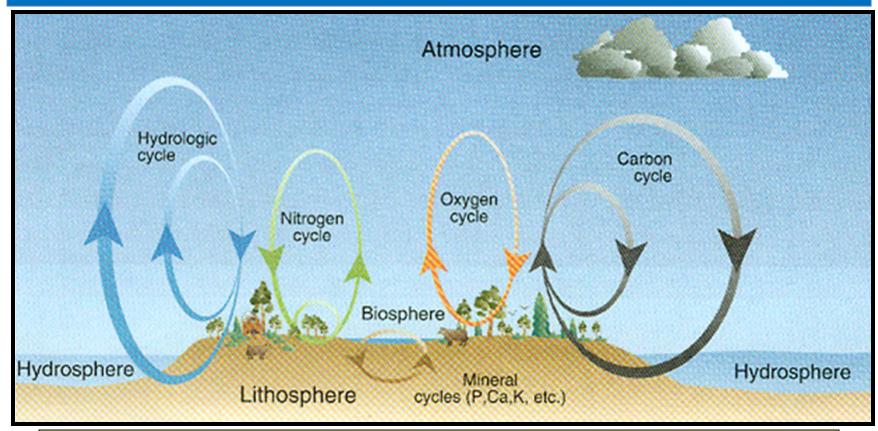

- Climax community is a term in ecology describing the combination of lifeforms (flora/fauna/fungi) existing undisturbed at a particular location.
- ✓ The community developed over time in response to a set of physical conditions and has been stabilized.
- ✓ A change in any of the conditions will upset the dynamic, destabilize it and put change into motion.
- ➤ Examples of disruption include global climate change, deforestation, reservoir building, species extinction, wildfire, human interference in life cycles, as killing local predator animals.

NATURAL CONTROLS and CYCLES

- ✓ A. Temperature Controls: rotation (day and night), revolution (the seasons), cloud cover, and ocean circulation (surface, deep sea).
- ✓ B. Geologic Cycle: plate tectonics, rock cycle, building and gradational forces
- > C. Biogeochemical Cycles
 - 1. Hydrologic (water) cycle
 - 2. Carbon-Oxygen cycle
 - 3. Nutrient cycle

All these controls and cycles are interrelated.

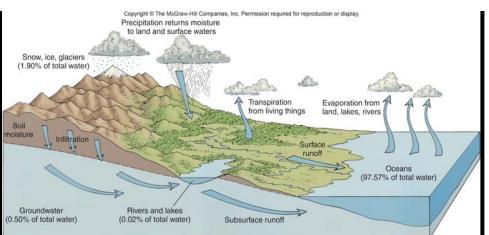

Biogeochemical Cycles

Biogeochemical cycles transfer matter between the atmosphere, hydrosphere, and lithosphere.

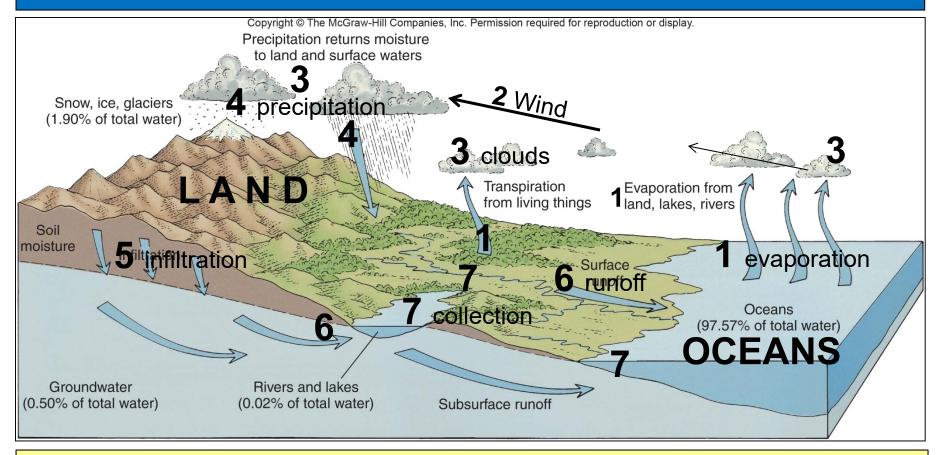

The cycles shown here are diagrammatic and therefore simplified.

- 1. Evaporation process
 - removes water molecules from oceans, lakes, land and biota leaving behind salts and pollutants.
- 2. Wind moves atmospheric moisture around the globe.
- 3. Clouds are created at the condensation point.
- **4. Precipitation** occurs after saturation is reached; returns water to the earth's surface where it is collected and stored.
- 5. Infiltration soaks it into the ground (percolation).
- Runoff is when water flows over the land.
- 7. Water returns to the oceans, lakes, land and biota to begin the cycle again when it is discharged.

Hydrologic Cycle

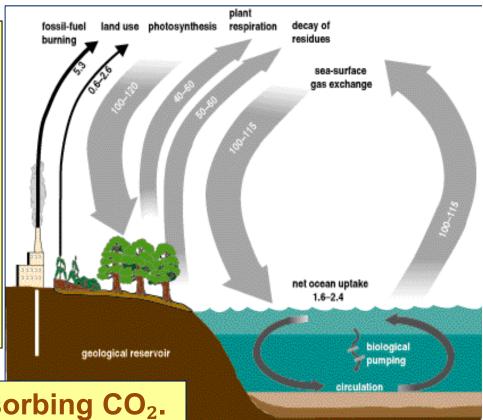

88% of all evaporation is from the oceans.

WATER ON LAND: 77% frozen; 22% underground; 1% surface of which only 0.6% is in lakes and rivers.

Carbon-Oxygen Cycle

Carbon dioxide (CO_2) is created by respiration, decay and combustion which uses oxygen (O_2) in the process.

Photosynthesis: removes CO₂ and creates O₂.

- ➤ Oceans play a great role in absorbing CO₂. Algae and marine life absorb it to create shells and eventually carbonate rocks.
- ➤ Human production of CO₂ is *faster* than plants and the oceans can absorb it.

Carbon-Oxygen Cycle

NEGATIVE Variables of Human Impact

- **1. Deforestation** (decreases absorption of CO₂)
- 2. Burning of fossil fuels (adds more CO₂)
- 3. Urbanization (decreases absorption; adds more CO₂)
- **4. Pollution of the ocean surface** (decreases absorption of CO₂)
- **5. Global warming** (melting of permafrost/ice pack releases stored CO₂ and other greenhouse gasses therefore adds more CO₂ to the atmosphere)

Nitrogen Cycle Nitrogen fixing Denitrification **Bacteria** Bacteria Nitrification NO₃

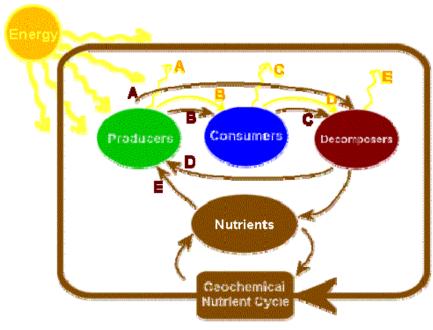

NHa

For nitrogen (N₂) to be used, it has to be converted into water-soluble compounds, esp. ammonia (NH₃) and nitrate (NO₃). Plants can absorb them with water intake and use them to make chlorophyll (needed for photosynthesis).

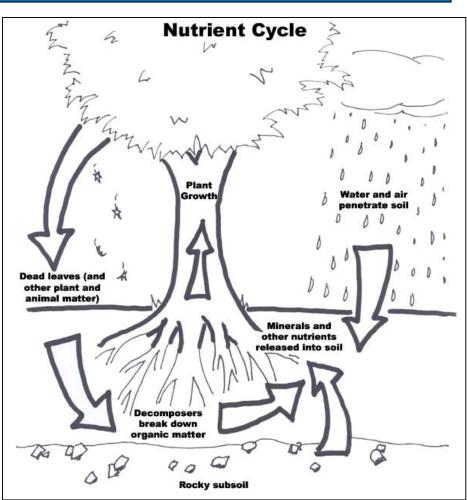

Bacteria

- Nitrogen fixation: the process that makes nitrogen usable. It occurs two ways in nature:
- (1) in the soil by the **nitrogen**fixing bacteria found on certain plant roots; and (2) in the air by lightning which converts atmospheric N₂ (via an intense electrostatic discharge) into ammonia and nitrate and returns it to earth with rain or snow.
- Manufacturers convert nitrogen gas into ammonia, nitrates and nitrites and incorporate it into nitrogen-rich fertilizers used by farmers to supplement the amount in the soil.
- Denitrification completes the cycle by converting nitrate (NO₃) back to a gas (N₂).

Nutrient Cycle

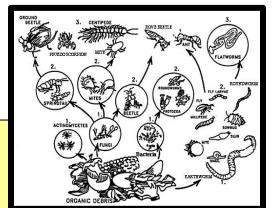

- ✓ Water and temperature dependent.
- > Too dry or too cold slows the process.

Nutrient Cycle

The nutrient cycle adds fertility to the soil. There are 3 aspects of the cycle:

- 1. DECOMPOSITION: rotting organic material (mixes with inorganic material to give a balanced soil).
- 2. FIRE: ash residue from burnt vegetation (ash and vaporized nutrients released into atmosphere mix with rainwater which is absorbed by the soil. NOTE: ash is naturally alkaline and counteracts a higher acidic pH levels in a soil.)
- 3. FLOODING: enriched sediment and water (seasonal flooding leaves behind a layer of organic and inorganic nutrients taken from upstream areas; supplements local nutrients).

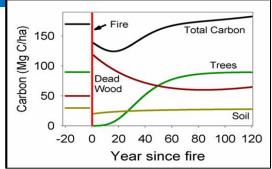

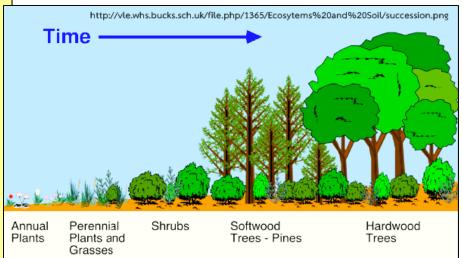

Benefits of a Forest Fire

- Nutrient release to soil, esp. when mixed with rainwater.
- Regrowth of remnant roots and seeds
- Allows <u>expansion of neighboring ecosystems</u> (climax vegetation sequence begins)
- Rapid restoration of energy flow and nutrient cycling (exposure to sunlight; thinner atmosphere/lithosphere interface; better water absorption)

Also,

- Reduces chance of catastrophic fire
- Controls insect pests
- Controls plants diseases
- Adds to biodiversity (flora and fauna)

NUTRIENT CYCLE: Human impact

The nutrient cycle has been affected by:

- Land alternation: cutting forests, plowing grasslands, urbanization, suburbanization, roads
- Dousing forest/grassland fires
- Stream alteration: dam building, dredging, levees
- Land pollution: landfills, mining waste, toxic spills
- Misuse of artificial fertilizers/herbicides: affect organisms in biosphere (soil); cause water pollution, eutrophication (oxygen depletion in water), adverse effects on life forms (toxicity).

NEXT

Natural Hazards and Human Impact

NOTE CHANGES >>

PART II Exam Topics:

- I. Intro. to the Physical Environment
- II. Earth-Sun Relationship
- III. Earth Systems
 - The Hydrosphere: Oceans
 - The Atmosphere: Weather and Climate
 - The Lithosphere: Geologic Influences

IV. Earth Habitat and Environmental Protection

- The Biosphere: Zones of Life
- Natural Controls and Cycles
- Human Impact
- Natural Hazards
- Earth Resources

NEW DATE

EXAM 2 is now Tuesday, April 21 on BlackBoard

Be sure you know how to enter BlackBoard and access the timed exam which starts and stops automatically

Exam 2 will cover all the topics in Part II.

See Study Guide II on the course home page for definitions and place names for North America, South America and Antarctica.
